Fundamentals of Aquacultural Engineering From Springer

Aquaculture is the science and technology of balanced support from the biological and engineering producing aquatic plants and animals. It is not new science. However, commercial aquaculture, but has been practiced in certain Eastern cultures has become so complex that, in order to produce cultures for over 2,000 years. However, to be successful, one must also draw upon the expertise of aquaculture in helping to meet the world's need of biologists, engineers, chemists, economists, food technologists, marketing specialists, lawyers, and others. The multidisciplinary approach to aquaculture production became a new source of an unlimited food supply. Bioengineering during the early 1990s. It is believed that logical studies indicate that the maximum sustainable yield of marine species through aquaculture production becomes more and more intensive in order for the producer to squeeze as much product as harvest of wild stock is 100 million MT (metric tons) per year. Studies also indicate that we are rapidly approaching the maximum sustainable yield of the world's oceans and major freshwater bodies. Per capita consumption of fishery production.

Editorial Review

Review

`Books such as this provide a means for biologists and engineers to develop a better appreciation and understanding of one another's approaches and the rationale for those approaches. In that vein, the book presents a rather simplistic overview of the biological side of aquaculture, and similarly, presents the engineering aspects of aquaculture at a level that can be easily understood by the nonengineer.'
